I/O Expansion

- Need more I/O lines/pins?
→ (a) use a different μC or (b) expand I/O using *shift registers*

What is a shift register?

D Flip-Flops are cascaded
Q to D and the clocks paralleled
to form a shift register

Basic types of shift registers:

- Serial-in/serial-out
- Parallel-in/serial-out
- Serial-in/parallel-out
- Ring
- ...

- The 74HC4094 is an 8-bit serial-in/serial- or parallel-out shift register with a storage register and 3-state outputs.
- Both the **shift** and **storage register** have separate clocks.
- The device features a serial input (D) and serial outputs to enable cascading.
- Data is shifted on the LOW-to-HIGH transitions of the CP input.
- The data in the shift register is transferred to the storage register when the STR input is HIGH.

- Data in the storage register appears at the outputs whenever the output enable input (OE) is HIGH.
- A LOW on OE causes the outputs to assume a high-impedance OFF-state.
- Operation of the OE input does not affect the state of the registers.

3 Description

The TPIC6C595 is a monolithic, medium-voltage, low-current power 8-bit shift register designed for use in systems that require relatively moderate load power such as LEDs. The device contains a built-in voltage clamp on the outputs for inductive transient protection. Power driver applications include relays, solenoids, and other low-current or medium-voltage loads.

This device contains an 8-bit serial-in, parallel-out shift register that feeds an 8-bit D-type storage register. Data transfers through both the shift and storage registers on the rising edge of the shift register clock (SRCK) and the register clock (RCK), respectively. The device transfers data out the serial output (SER OUT) port on the rising edge of SRCK. The storage register transfers data to the output buffer when shift register clear (CLR) is high. When CLR is low, the input shift register is cleared. When output enable (\bar{O}) is held high, all data in the output buffers is held low and all drain outputs are off. When \bar{O} is held low, data from the storage register is transparent to the output buffers. When data in the output buffers is low, the DMOS transistor outputs are off. When data is high, the DMOS transistor outputs have sink-current capability. The SER OUT allows for cascading of the data from the shift register to additional devices.

Outputs are low-side, open-drain DMOS transistors with output ratings of 33-V to 100-mA continuous sink-current capability. Each output provides a 250-mA maximum current limit at $T_J = 25^\circ\text{C}$. The current limit decreases as the junction temperature increases for additional device protection. The device also provides up to 2500 V of ESD protection when tested using the human-body model and the 200-V machine model.

The TPIC6C595 is characterized for operation over the operating case temperature range of -40°C to 125°C .

TPIC6C595 – Absolute Maximum Ratings

→ Values of voltage, current, temperature, power dissipation etc., which should not be exceeded at any time → otherwise deterioration/destruction of the IC may take place

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) ⁽¹⁾

	MIN	MAX	UNIT
V_{CC} Logic supply voltage ⁽²⁾	-0.3	7	V
V_I Logic input voltage	-0.3	7	V
V_{DS} Power DMOS drain-to-source voltage ⁽³⁾	-0.3	33	V
Continuous source-to-drain diode anode current	0	250	mA
Pulsed source-to-drain diode anode current ⁽⁴⁾	0	500	mA
I_D Pulsed drain current, each output, all outputs on, $T_C = 25^\circ\text{C}$ ⁽⁴⁾	0	250	mA
I_D Continuous drain current, each output, all outputs on, $T_C = 25^\circ\text{C}$ ⁽⁴⁾	0	100	mA
I_{DM} Peak drain current single output, $T_C = 25^\circ\text{C}$ ⁽⁴⁾	0	250	mA
E_{AS} Single-pulse avalanche energy (see Figure 11)	0	30	mJ
I_{AS} Avalanche current ⁽⁵⁾	0	200	mA
Continuous total dissipation	See Thermal Information		
T_J Operating virtual junction temperature	-40	150	$^\circ\text{C}$
T_C Operating case temperature	-40	125	$^\circ\text{C}$
T_{stg} Storage temperature	-65	150	$^\circ\text{C}$

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) All voltage values are with respect to GND.

(3) Each power DMOS source is internally connected to GND.

(4) Pulse duration $\leq 100 \mu\text{s}$ and duty cycle $\leq 2\%$.

(5) DRAIN supply voltage = 15 V, starting junction temperature (T_{JS}) = 25°C , $L = 1.5 \text{ H}$, $I_{AS} = 200 \text{ mA}$ (see Figure 11).

TPIC6C595 – Operating Conditions

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

	MIN	MAX	UNIT
V_{CC} Logic supply voltage	4.5	5.5	V
V_{IH} High-level input voltage	0.85 V_{CC}		V
V_{IL} Low-level input voltage		0.15 V_{CC}	V
Pulsed drain output current, $T_C = 25^\circ\text{C}$, $V_{CC} = 5\text{ V}$, all outputs on ⁽¹⁾ (see Figure 7)		250	mA
t_{su} Setup time, SER IN high before SRCKM \uparrow (see Figure 9)	20		ns
t_h Hold time, SER IN high after SRCKM \uparrow , (see Figure 9)	20		ns
t_w Pulse duration (see Figure 9)	40		ns
T_C Operating case temperature	-40	125	$^\circ\text{C}$

- (1) Pulse duration $\leq 100\ \mu\text{s}$ and duty cycle $\leq 2\%$.
 (2) Technique should limit $T_J - T_C$ to 10°C maximum.

AVR Subroutine for Displaying a Digit

- A (long) sequence of SBI and CBI instructions could be used to display a number on the 7-seg. display
- Better approach: generate a general useable display subroutine

```
; put code here to configure I/O lines
; connected to TPIC6C595 as output
...

; start main program
...

; display a digit
ldi R16, 0x70 ; load pattern to display
rcall display ; call display subroutine
...
```

```
display:
; backup used registers on stack
push R16
push R17
in R17, SREG
push R17

ldi R17, 8 ; loop --> test all 8 bits
loop:
rol R16 ; rotate left through Carry
BRCS set_ser_in_1 ; branch if Carry set
; put code here to set SER_IN to 0
...
rjmp end
set_ser_in_1:
; put code here to set SER_IN to 1
...
end:
; put code here to generate SRCK pulse
...

dec R17
brne loop

; put code here to generate RCK pulse
...

; restore registers from stack
pop R17
out SREG, R17
pop R17
pop R16

ret
```

Lab 2 Notes Slide 22

Example

Consider the following AVR program:

```
ldi R16, 0x00
out SREG, R16
ldi R16, 0xC3
rol R16
```

- What will be the content of R16?
- Which bits in SREG will be set to 1?

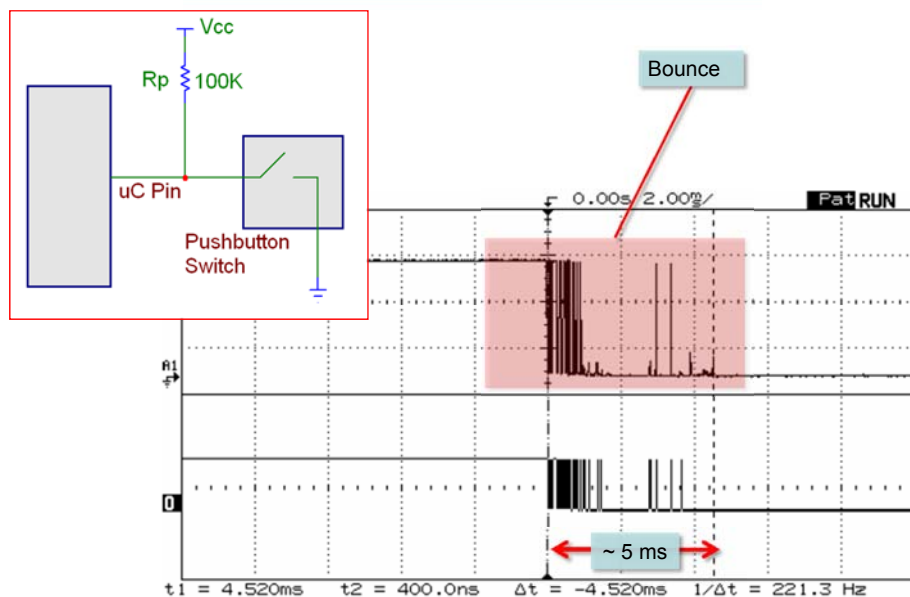

SREG – AVR Status Register

The AVR Status Register – SREG – is defined as:

Bit	7	6	5	4	3	2	1	0	
0x3F	I	T	H	S	V	N	Z	C	SREG
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
Initial Value	0	0	0	0	0	0	0	0

Switch Bounce and Debouncing

Switch Bounce and Debouncing

Hardware Debounce

When the switch closes, the capacitor discharges through R_b

Question: what is the fall time?

Make sure you can calculate this.

Embedded Systems, ECE:3360. The University of Iowa, 2019

Lab 2 Notes Slide 25

Software Debounce

One idea. Sample n times at regular intervals, say 10 ms apart. Count how many times the switch is zero. If this is larger than the number of times the switch is high, consider the switch pressed.

```
char isPressed(void)
{
    char ones=0, zeroes=0, i;

    for(i=0;i<=10-1;i++){
        if(PINA&0x01){ // read pin == 1
            ones++;
        } else {      // read pin == 0
            zeroes++;
        }
        _delay_ms(10);
    }
    return (ones > zeroes);
}
```

Embedded Systems, ECE:3360. The University of Iowa, 2019

Lab 2 Notes Slide 26

Testing Status of an I/O PIN

Hardware Debounce

```
...
cbi  DDRB,0
cbi  DDRB,1
...
SBIS PINB,0
...
```

Branch instruction:
SBIC (Skip next instruction if **B**it in I/O is **C**lear)

```
...
cbi  DDRB,0
cbi  DDRB,1
...
SBIS PINB,0
...
```

This instruction tests a single bit in an I/O register and skips the next instruction if the bit is set.

For input use **PINB**, not **PORTB**

Which PIN to Use?

Hardware Debounce

There are 5 PINs available for use as switch input: PB0, PB1, PB2, PB3 and PB4.

Which one should you use?

These are used by the programmer when it downloads code, so adding a debounce capacitor may interfere. You may have to experiment which PIN works best as an input pin.
